Details of animal

Sample: 09-34812
Animal: Erland Aiaskima
Breed: Samojed
Reg. number: 1754
Microchip: 203098100221875
Year of birth: 04.01.2006
Sex: male
Date received: 15.12.2009
Sample type: buccal swab

Result: Based on mutation examination genotype was determined Xn/Y

Explanation

Mutation 1028_1032delGAGAA in exon ORF15 of RPGR gene (retinitis pigmentosa GTP's regulator) was tested. This mutation causes X-linked progressive retinal atrophy diseases in Siberian Husky and Samoyed breeds. The first symptoms appear by clinical examination in 6 months. Later, rods light receptors begin to appear irregularly damaged. Cones damage arises in final stage of XL-PRA disease. In age of 4 years, affected dogs are usually completely blind.

Females have XX chromosomes so they can have following XL-PRA genotypes:

XnXn – females with two normal X chromosomes = normal phenotype, a healthy female

XnXm – females with one normal X (Xn) and one mutant X (Xm) = a female carrier. Clinical disability of female carriers is individual, depending on the X chromosome inactivation.

XmXm – females with two mutated X chromosomes = an affected female

Males have XY chromosomes so they can have following XL-PRA genotypes:

XnY – normal phenotype, a healthy male

XmY – an affected male; he inherited mutated X chromosome from his mother

Method: SOP24, unaccredited method

Sensitivity (probability of correct identification of the defective form of the gene in heterozygous or mutated homozygous) is higher than 99%. Specificity (probability of correct identification of the normal form of the gene in a normal homozygous or heterozygous) is higher than 99%.

Report date: 21.12.2009

Responsible person: Mgr. Martina Šafrová, Laboratory Manager

Genomia is accredited according to ISO 17025 under #1549.
